

## 2.8 The derivative as a function

1. derivative of  $f(x)$  導函數  $f'(x)$
2. differentiable function 可微函數
3. higher derivatives & other notations 高階導數與其他寫法  $\frac{df}{dx}$

### 0.1 Derivative of $f(x)$

**Recall:** The derivative of  $f$  at  $a$ ,  $f$  在  $a$  的導數:

$$f'(a) = \lim_{x \rightarrow a} \frac{f(x) - f(a)}{x - a} = \lim_{h \rightarrow 0} \frac{f(a + h) - f(a)}{h}.$$

收集  $\{(a, f'(a)) : a \in \text{domain of } f, \text{ and } f'(a) \text{ exists}\}$ , 可以看做一個函數:

**Define:** The *derivative* 導函數 of  $f$  is the function  $f'$  defined by

$$f'(x) = \lim_{h \rightarrow 0} \frac{f(x + h) - f(x)}{h}$$

if these limits exist.

**Note:**  $f'$  的 domain 在  $f$  的 domain 裡,  $f'$  的 range 跟  $f$  的 range 無關.

### 0.2 Differentiable function

**Define:** 單點可微: A function  $f$  is *differentiable* 可微分 at  $a$  if  $f'(a)$  exists.  
(可微分 = 有導數 =  $f'(x)$  有定義 = 有極限.)

**Define:** 區間可微: A function  $f$  is differentiable on an open interval if  $f$  is differentiable at every number in the interval.

**Note:** 整塊開區間只有四種:  $(a, b)$ ,  $(a, \infty)$ ,  $(-\infty, b)$ ,  $(-\infty, \infty)$ .

**Note:** 極限有左右, 連續有左右, 可微沒有左右;  $\therefore$  可微分的定義域不含端點.

**Theorem 1** (可微就連續)

If  $f$  is **differentiable** at  $a$ , then  $f$  is **continuous** at  $a$ .

**Proof.** By definition, the limit exists  $f'(a) = \lim_{x \rightarrow a} \frac{f(x) - f(a)}{x - a}$ . Then

$$\begin{aligned} \lim_{x \rightarrow a} f(x) &= \lim_{x \rightarrow a} [f(x) - f(a) + f(a)] \\ &= \lim_{x \rightarrow a} \left[ \frac{f(x) - f(a)}{x - a} (x - a) + f(a) \right] \\ &= \lim_{x \rightarrow a} \frac{f(x) - f(a)}{x - a} \cdot \lim_{x \rightarrow a} (x - a) + \lim_{x \rightarrow a} f(a) \\ &= f'(a) \cdot 0 + f(a) = f(a). \quad (\text{極限律: 加乘} c \& x) \quad \blacksquare \end{aligned}$$

**Note:** 可微就連續, 但反之不對, 連續不一定可微. (很常考觀念!)  
怎麼說明反過來不對? 找一個反例. 去哪找? 多認識一些函數.

**Example 0.1** Where is  $f(x) = |x|$  differentiable?

If  $x > 0$ ,  $|x| = x$ , and choose  $h$  near 0 enough such that  $x + h > 0$ ,  
then  $f'(x) = \lim_{h \rightarrow 0} \frac{|x + h| - |x|}{h} = \lim_{h \rightarrow 0} \frac{x + h - x}{h} = \lim_{h \rightarrow 0} 1 = 1$ .

If  $x < 0$ ,  $|x| = -x$ , and choose  $h$  near 0 enough such that  $x + h < 0$ ,  
then  $f'(x) = \lim_{h \rightarrow 0} \frac{|x + h| - |x|}{h} = \lim_{h \rightarrow 0} \frac{-(x + h) - (-x)}{h} = \lim_{h \rightarrow 0} -1 = -1$ .

$\lim_{x \rightarrow 0} f(x) = 0 = f(0)$ ,  $f$  is continuous at 0,

but  $\lim_{h \rightarrow 0^-} \frac{|0 + h| - |0|}{h} = \lim_{h \rightarrow 0^-} \frac{-h}{h} = -1 \neq 1 = \lim_{h \rightarrow 0^+} \frac{|0 + h| - |0|}{h} = \lim_{h \rightarrow 0^+} \frac{h}{h} = 1$ ,  
the limit does not exist. (左右不同極)

Therefore,  $f(x)$  is differentiable for  $x \neq 0$  (or  $(-\infty, 0) \cup (0, \infty)$ ).  $\blacksquare$

**Remark:** 連續函數: 不斷&傳極限, 可微函數: 長得很柔順.  
( $y = |x|$  在  $x = 0$  長得很不順.)

**Question:** 何時不可微? 切勿明知不可微而微之.

1. discontinuous: 由定理的等價論述, 不連續就不可微. ex:  $\sin \frac{1}{x}$  at 0.

2. corner: 左右極限不同.

3. **vertical tangent line**: 垂直切線  $x = a$  if  $\boxed{\lim_{x \rightarrow a} |f'(x)| = \infty}$ .

無限極限兩邊可能不同 ( $\infty / -\infty$ ):

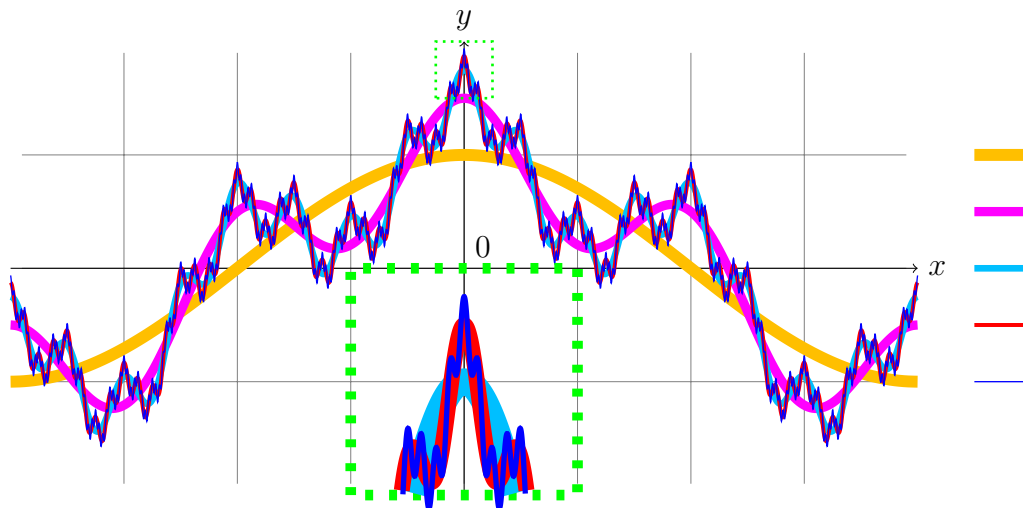

此處不可微, 自有可微處, 處處不可微, 薇薇宮中狂 Weierstrass function.

◆: 1872, Karl Theodor Wilhelm Weierstrass:

處處連續處處不可微的函數 Weierstrass function

$$\sum_{n=0}^{\infty} a^n \cos(b^n \pi x), \text{ where } 0 < a < 1, b \text{ positive odd integer, } ab > 1 + \frac{3}{2}\pi.$$

### 0.3 Higher derivatives & other notations

1. Derivative:  $\boxed{f'(x)}$ ,  $\frac{df}{dx}$ ,  $\boxed{\frac{d}{dx}f(x)}$ ,  $Df(x)$ ,  $D_x f(x)$ ,

where  $\frac{d}{dx}$ ,  $D$ ,  $D_x$ : differentiation operators 微分算子.

2. When  $y = f(x)$ :  $\boxed{y'}$ ,  $\boxed{\frac{dy}{dx}}$ .

Leibniz:  $\frac{dy}{dx} = \lim_{\Delta x \rightarrow 0} \frac{\Delta y}{\Delta x}$ , where  $\Delta y = f(x + \Delta x) - f(x)$ .

3.  $\boxed{f'(a)}$ ,  $\boxed{\frac{d}{dx}f(x) \Big|_{x=a}}$ ,  $\boxed{\frac{dy}{dx} \Big|_{x=a}}$ ,  $\frac{dy}{dx} \Big|_{x=a}$ .

**Attention:** 注意!  $\boxed{f'(a) = \frac{d}{dx}f(x) \Big|_{x=a} \neq \frac{d}{dx}f(a) (= 0)}$

左邊是先微分再代入 (導數), 右邊是先代入再微分 (零).

4. 高階導數 (second derivative, third derivative, ...,  $n$ -th derivative)

$(f')' = \boxed{f''}$ ,  $(f'')' = \boxed{f'''}$ ,  $(f''')' = f^{(4)}$ , ...,  $(f^{(n-1)})' = \boxed{f^{(n)}}$ .

$\frac{d}{dx} \left( \frac{dy}{dx} \right) = \frac{d^2 y}{dx^2}$ ,  $\frac{d}{dx} \left( \frac{d^2 y}{dx^2} \right) = \frac{d^3 y}{dx^3}$ , ...,  $\frac{d}{dx} \left( \frac{d^{n-1} y}{dx^{n-1}} \right) = \boxed{\frac{d^n y}{dx^n}}$ .

$\frac{d}{dx} \left( \frac{d}{dx} f(x) \right) = \frac{d^2}{dx^2} f(x)$ , ...,  $\frac{d}{dx} \left( \frac{d^{n-1}}{dx^{n-1}} f(x) \right) = \boxed{\frac{d^n}{dx^n} f(x)}$ .

**Example 0.2**  $f(x) = x^3 - x$ , find and draw  $f'$  and find  $f''$ .

$$\begin{aligned}
 f'(x) &= \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h} \\
 &= \lim_{h \rightarrow 0} \frac{(x+h)^3 - (x+h) - x^3 + x}{h} \\
 &= \lim_{h \rightarrow 0} \frac{3hx^2 + 3h^2x + h^3 - h}{h} \\
 &= \lim_{h \rightarrow 0} (3x^2 + 3hx + h^2 - 1) = 3x^2 - 1. \\
 f''(x) &= \lim_{h \rightarrow 0} \frac{f'(x+h) - f'(x)}{h} \\
 &= \lim_{h \rightarrow 0} \frac{3(x+h)^2 - 1 - 3x^2 + 1}{h} \\
 &= \lim_{h \rightarrow 0} \frac{6hx + 3h^2}{h} = \lim_{h \rightarrow 0} (6x + 3h) = 6x. \quad \blacksquare
 \end{aligned}$$

**Observation:**  $y = f(x)$  在  $x = a$  水平  $\iff$  切線斜率  $f'(a) = 0$ .

**Example 0.3**  $f(x) = \sqrt{x}$ , find derivative of  $f$ ,  $f'$  and state its domain.

$$\begin{aligned}
 f'(x) &= \lim_{h \rightarrow 0} \frac{\sqrt{x+h} - \sqrt{x}}{h} \\
 &= \lim_{h \rightarrow 0} \left( \frac{\sqrt{x+h} - \sqrt{x}}{h} \cdot \frac{\sqrt{x+h} + \sqrt{x}}{\sqrt{x+h} + \sqrt{x}} \right) \\
 &= \lim_{h \rightarrow 0} \frac{x+h-x}{h(\sqrt{x+h} + \sqrt{x})} \\
 &= \lim_{h \rightarrow 0} \frac{1}{\sqrt{x+h} + \sqrt{x}} = \frac{1}{2\sqrt{x}}, \\
 &\text{and the limit exists only for } x > 0.
 \end{aligned}$$

Therefore,  $f' = \frac{1}{2\sqrt{x}}$  with domain  $(0, \infty)$ . ( $\sqrt{x}$  的 domain 是  $[0, \infty)$ .)  $\blacksquare$

(這例子也說明開根函數在  $x > 0$  是 [有導數=可微分  $\implies$  ]連續函數.)

◆: A function  $f$  is called **symmetrically differentiable**(對稱可微) at a number  $a$  if the limit exists:

$$\lim_{h \rightarrow 0} \frac{f(a+h) - f(a-h)}{2h}$$

$$\text{極限} \iff \text{左極} = \text{右極}$$

$$\text{可微} \implies \text{連續} \iff \text{極限} = \text{函數值}$$

次節預告：

用極限去算導數太辛苦了, Sect 3 介紹能幫助快速計算的 differentiation rule  
微分法則: 加減乘除常數倍, 冪次 & 多項式, 指數 & 對數, 三角 & 反三角, 合成  
函數 (chain rule), 隱函數 & 反函數 (implicit differentiation).
